Note, 21 Jul 18:

Degree of slope of pediment as indicated by the cross-section matches that of AT 289, a fragmentary block of the pedimental gable, front on which base preserves the slope of the pediment. It also matches pediment given AT 194.

Further note: remeasurement

of ht. of pediment block at left and (as one faces front of block) production a ht. of 0.380 as opposed to either 0.357 (actually drawn as 0.361) or 0.351. I have not calculated how much this would affect the slope.

Given the fact that the cross-section AT 289, and AT 194 all match closely, I am going to assume the measurement given on the cross-section should be used rather than mine of 0.380.

Finally, it is not clear which end of the pediment is which in the cross-section since it is not oriented correctly with the rest of the drawing.
